BERT - Reranker

Architecture

- vanilla BERT, mono BERT, simply BERT
- Input : [CLS] Query [SEP] Document
- Output from [CLS] token
- Predict score with a single neural layer
- $r = BERT([CLS]; q_{1...n}; [SEP]; d_{1...m})_{CLS}$
- choice of any BERT model
- \bullet s = $r \times W$
- cross entropy loss

Problem of vanilla BERT Ranker

Longer Documents

max 512 BERT Tokens

Time Latency

- Effective but very slow!
- Solution 1: reduce model size
- Solution 2: Precompute documents

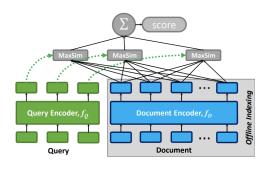

urav Neural IR July 17, 2021 4/9

- Encodes query and documents with BERT vectors
- Late interactions of Query terms and Docs

urav Neural IR July 17, 2021 5/9
